Leukocystatin, a new class II cystatin expressed selectively by
hematopoietic cells.";
J. Biol. Chem. 273:16400-16408(1998).
I- FUNCTION: INILIBITS PAPAIN AND CATHEPSIN L BUT WITH AFFINITIES
LOWER THAN OTHER CYSTATINS. MAY PLAY A ROLE IN IMMUNE REGULATION
THROUGH INHIBITION OF A UNIQUE TARGET IN THE HEMATOPOIETIC SYSTEM.
-! SUBCELLULAR LOCATION: Secreted (Probable).
-! SIBLIARITY: BELONGS TO THE CYSTATIN FAMILY.

-I- FUNCTION: RECOGNIZES THE DOUBLE-STRANDED SEQUENCE CGG AND CLEAVES AFTER C-1.

-I- CATALYTIC ACTIVITY: Endonucleolytic cleavage of DNA to give specific double-stranded fragments with terminal 5' phosphates.
                                                    01-JUN-1994 (Rel. 29, Created)

A;Title: Structural organization of the human kininogen gene and a model for its evoluti A;Reference number: A92545; MUID:85234583
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Kininogen, HWW precursor (validated) - human
NiAlternate names: alpha-2-thiol proteinase inhibitor; preprokininogen; prokininogen
NiAlternate names: alpha-2-thiol proteinase inhibitor; preprokininogen; prokininogen
NiContains: bradykinin (kallidin I); HWW kininogen I; HWW kininogen II; low molecular we

Proc. 27, 52-57, 1968
A.Title: Structural features of plasma kinins and kininogens.
A.Fitle: Structural features of plasma kinins and kininogens.
A.Feference number: A01455; MUID:90255622
A.Contents: annotation; bradykinin
C;Comment: The HMW kininogen precursor and the LMW form are produced from the same gene
C;Comment: Kininogen is a cystelahe protechanse inhibitor, takes part in initiation of the
C;Comment: The glycine/histidine/lysine-rich region of HWW kininogen light chain is impo
C;Comment: Bradykinin, released from kininogen by kallikrein, is a potent vasodilator, i

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C. -!- FUNCTION: (1) KININOGENS ARE INHIBITORS OF THIOL PROTEASES; (2)
HWA-KININOGEN PLAYS AN IMPORTANT ROLE IN BLOOD COAGULATION BY '
HELPING TO POSITION OPTIMALLY PREKALLIKREIN AND FACTOR XI NEXT TO
FACTOR XII; (3) HWM-KININOGEN INHIBITS THE THROMEN-AND PLASMIN-
INDUCED AGGREGATION OF THROMBOCYTES; (4) THE ACTIVE PEPTIDE
BRADKININ THAT IS RELEASED FROM HWW-KININOGEN SHOWS A VARIETY OF
PHYSIOLOGICAL EFPECTS: (4A) INFLUENCE IN SMOOTH MUSCLE
CONTRACTION, (4B) INDUCTION OF HYPOTENSION, (4C) NATRIURESIS AND
DIURESIS, (4D) DECREASE IN BLOOD GLUCOSE LEVEL, (4E) IT IS A
MEDIATOR OF INFLAMMATION OF NOCICEPTORS (4E3) RELEASE OF
COTHER MEDIATORS OF INFLAMMATION (E.G. PROSTAGLANDINS), (4F) IT HAS
CARDIOPROFERIYE FEFECT (DIRECTLY UNDERLY) FACTON, (5)
LMW-KININOGEN INHIBITS THE AGGREGATION OF THROMBOCYTES, (6) LMW-
COTTOR THE CONTRAST TO HMM-KININOGEN NOT INVOLVED IN BLOOD
                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. -!- FUNCTION: (1) KININOGENS ARE INHIBITORS OF THIOL PROTEASES; (2)

-LAW-KININOGEN INHIBITS THE AGGREGATION OF THROMBOCYTES; (3) THE
ACTIVE PEPTIDE KALLIDIN THAT IS RELEASED FROM LAW-KININOGEN SHOWS
A VAREETY OF PHYSIOLOGICAL EFFECTS: (3A) INFLUENCE IN SMOOTH
MUSCLE CONTRACTION, (3B) INDUCTION OF HYPOTENSION, (3C)

NATRIORESIS AND DIURESIS (KIDDEY).

-!- SUBCELJULAR LOCATION: Extracellular.

-!- SUBCELJULAR PRODUCTS: HWW II AND LAW II KININOGEN PRECURSORS ARE
PRODUCED FROM THE SAME GENE AS THE RESULT OF ALTERNATIVE MINA
SPLICING. THE SEQUENCES OF BOTH KININOGENS ARE IDENTICAL UP
                                                                                                                                                                                                                                                                                                              -i- PTM: BRADYKININ IS RELEASED FROM KININOGEN BY PLASMA KALLIKREIN.
-i- MISCELLANEOUS: LAW-KININOGEN IS IN CONTRAST TO HWW-KININOGEN NOT
INVOLVED IN BLOOD CLOTTING.

J. Biol. Chem. 263:2768-2779(1987).
J. FUNCTION: (1) KININOGENS ARE INHIBITORS OF THIOL PROTEASES; (2)
LAM-KININOGEN INHIBITS THE AGGREGATION OF THROMBOCYTES; (3) THE
ACTIVE PEPTIDE KALLIDIN THAT IS RELEASED FROM LAM-KININOGEN SHOWS
A VARIETY OF PHYSIOLOGICAL EFFECTS: (3A) INFLUENCE IN SMOOTH
MUSCLE CONTRACTION, (3B) INDUCTION OF HYPOTENSION, (3C)
NATRIURESIS AND DIURESIS (KIDNEY).
I- SUBCELLULAR LOCATION: EXTERCELLULAR.
PRODUCED FROM THE SAME GENE AS THE RESULT OF ALTERNATE MRNA
SPLICING: THE SEQUENCES OF BOTH KININOGENS ARE IDENTICAL UP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TISSUE SPECIFICITY: PLASMA.
PTM: BRADYKININ IS RELEASED FROM KININOGEN BY PLASMA KALLIKREIN.
MISCELLANEOUS: LMW-KININOGEN IS IN CONTRAST TO HMW-KININOGEN NOT

A thinogen. Amino acid sequence of a fragment ('histidine-rich peptide') released by plasma kallikrein.";

I peptide') released by plasma kallikrein.";

J. Blochem. 77:55-68(1975)

C --- FUNCTION: (1) KININOGENS ARE INHIBITORS OF THIOL PROTEASES; (2) HWW-KININOGEN PLAYS AN IMPORTANT ROLE IN BLODD COAGULATION BY HELPING TO POSITION OPTIMALLY PREKALLIKREIN AND FACTOR XI NEXT TO FACTOR XII; (3) HWW-KININOGEN INHIBITS THE THROMBIN- AND PLASMIN-INDUCED AGGREGATION OF THROMBOCYTES; (4) THE ACTIVE PEPTIDE BRADYKININ THAT IS RELEASED FROM HWW-KININOGEN SHOWS A VARIETY OF PHYSIOLOGICAL BFFECTS: (4A) INFLUENCE IN SMOOTH WUSCLE CONTRACTION, (4B) INDUCTION OF HYPOTENSION, (4C)

NATRIURESIS AND DIURESIS, (4D) DECREASE IN BLOOD GLUCOSE LEVEL, (4E) IT IS A MEDIATOR OF INFLAMMATION AND CAUSES (4E1) INCREASE IN VASCULAR PERWEABILITY, (4E2) STIMULATION OF NOCICEPTORS (4E3) RELEASE OF OTHER MEDIATORS OF INPLAMMATION (E.G. PROSTAGLANDINS), (4F) IT HAS A CARRIDORPOTENTY BEPECTIV VIA BRADYKININ CHANNO CHANNO FOLDER ACTION, INDIRECTLY VIA BRADYKININ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SUBCELTULAR LOCATION: EXTRACEILULAR.
-!- ALTERNATIVE PRODUCTS: HWW II AND LAW II KININOGEN PRECURSORS ARE PRODUCED FROM THE SAME GENE AS THE RESULT OF ALTERNATE MRNA SPLICING. THE SEQUENCES OF BOTH KININOGENS ARE IDENTICAL UP

BLOL. Chem. 260:12054-12059(1985).

-1. FUNCTION: KININGGENS ARE PLASMA GLYCOPROTEINS WITH A NUMBER OF FUNCTION: (1) AS PRECURSOR OF THE ACTIVE PEPTIDE BRADYKININ THEY EFFECT SMOOTH MUSCLE CONTRACTION, INDUCTION OF HYPOTENSION AND INCREASE OF VASCULAR PERREABILITY. (2) THEY PLAY A ROLE IN BLOOD COAGULATION BY HELPING TO POSITION OPTIMALLY PREKALLIKREIN AND FACTOR XI NEXT TO FACTOR XII. (3) THEY ARE INHIBITOR OF THIOL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              T-KININGEN I IS RAISED.
PTM: AS T-KININ IS PRECEDED BY A MET INSTEAD OF AN ARG OR LYS, IT
IS NOT RELEASED FROM ITS PRECURSOR BY EITHER TISSUE OR PLASMA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- SUBCELLULAR LOCATION: Extracellular.
-!- TISSUE SPECIFICITY: PLASMA.
-!- INDUCTION: IN RESPONSE TO AN INFLAMMATORY STIMULANT. T-KININGEN
II SYNTHESIS IS INDUCED AND THE PLASMA CONCENTRATION OF

-!- FUNCTION: (1) KININOGENS ARE INHIBITORS OF THIOL PROTEASES; (2)

-!- FUNCTION: (1) KININOGEN PREVALINED SOF THIOL PROTEASES; (2)

--- HWW-KININOGEN PLAYS AN IMPORTANT ROLE IN BLOOD COAGULATION BY

HELPING TO POSITION OPTIMALLY PRERALLIKEEIN AND FACTOR NEXT TO

FACTOR XII; (3) HWW-KININOGEN INHIBITS THE THROMBIN-AND PLASMIN-

INDUCED AGERGEATION OF THROMBON-YERS; (4) THE ACTIVE PEPTIDE

BRADKKININ THAT IS RELEASED FROM HWW-KININOGEN SHOWS A VARIETY OF

PHYSIOLOGICAL EFFECTS: (4A) INFLUENCE IN SMOOTH MUSCLE

CONTRACTION, (4B) INDUCTION OF HYPOTEBRION, (4C) NATRURESIS AND

DIURESIS, (4D) DECREASE IN BLOOD GLUCOSE LEVEL, (4E) IT IS A

MEDIATOR OF INFLAMMATION AND CAUSES (4E1) HURREASE IN VASCULAR

COTHER MEDIATORS OF INFLAMMATION (E.G. PROSTAGLANDINS), (4F) IT HAS

COTHER MEDIATORS OF INFLAMMATION OF COCCEPPORS (4E3) IT HAS

COTHER MEDIATORS OF INFLAMMATION OF REAXING FACTOR ACTION, (5)

LIMW-KININOGEN INHIBITS THE AGGREGATION OF THROMBOCYTES; (6) LMM-

KININOGEN IS IN CONTRAST TO HWW-KININOGEN NOT INVOLVED IN BLOOD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

FUNCTION: THIS PROTEIN CAUSES EXPRESSION OF GLUCOSE-REPRESSIBLE GENES UPON GLUCOSE DEPRIVATION. IT INTERACTS AND HAS FUNCTIONAL RELATIONSHIP TO THE PROTEIN-KINASE SNFI.

-!- SUBCELLULAR LOCATION: Nuclear.

-!- SIMILARITY: BELONGS TO THE 5'-AMP-ACTIVATED PROTEIN KINASE, GAMMA SUBUNIT FAMILY.

-!- SIMILARITY: CONTAINS 4 CBS DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEQUENCE OF 30-34 AND 316-322.

                                                                                                                                                                                                                                                             ö
rheumatoid arthritis, and ocular disorders comprises a kininogen domain
                                               The present sequence is that of a C-terminal fragment of a novel anti-anglogenic D3 peptide (see AAY95408) derived from human high mol.wt. kininogen (HK) domain 3 (see AAY95426). The full-length D3 peptide inhibits endothelial cell proliferation and thus possesses anti-anglogenic activity. It is an example of peptides of the invention (see AAY95405-26) that are analogues of certain sites in the HK domain 3. The peptides inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting anglogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell apoptosis. Cancer, rheumatoid arthritis, and ocular disorders characterized by undesired vascularization of the retina are treated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a method for identifying a peptide having

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            thrombin-induced platelet; prevention; platelet aggregation;
a particular function. The method comprises preparing a database of polynucleotides and polypeptides of unknown functions, screening the database for a combination of nucleotides or amino acids indicative of the peptide with a particular function, and identifying polynucleotides and proteins which contain the peptide. The method is used to identify precursor peptides with an amidated C-terminus, especially polypeptide hormones, for studying physiologically active substances. The present sequence represents a peptide which was identified using the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Administration of a peptide or multimer related to bradykinin or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disclosed peptides and multimers can be used for the inhibition of thrombin-induced platelets or other cells. They can also be used for preventing platelet aggregation, or inhibiting ADP-induced activation. This is useful to prevent arterial occlusions arising from coronary thrombosis and stroke.
                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibition of platelet activation and aggregation - by admin. of

the human kininogen heavy chain. Domain 3 was isolated from low molecular weighth kininogen, derived from human plasma, by cleavage with trypsin. Domain 3 peptide inhibits platelet activation causing a marked decrease in the platelets ability to aggregate and secrete their granule contents. The granule contents contents properlies proteins which participate in hemostasis, thrombosis and the inflammatory response. Domain 3 also inhibits endothelial cell activation shown by a decrease
                                                         Domain 3; human; kininogen; heavy chain; low molecular weight; plasma; trypsin; platelet; activation; granule contents; hemostasis; thrombin; tissue plasminogen activator;thrombosis; inflammatory response; endothelial cell; von Willebrand factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in secretion of endothelial cell contents such as tissue plasminogen activator and von Milebrand factor. Domain 3 functions to inhibit cell activation by blocking thrombin binding to its target cells, the peptide is a selective inhibitor of thrombin-induced plattlet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence given represents domain 3, amino acids 246-362, of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition for inhibiting angiogenesis and endothelial cell proliferation, inducing endothelial cell apoptosis and treating cancer, rheumatoid arthritis, and ocular disorders comprises a kininogen domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of a D3 peptide derived from human high mol.wt. kiningen (HK) domain 3 (see AAY95426). The D3 peptide inhibits endothelial cell proliferation and thus possesses anti-angiogenic activity. It is an example of D3 peptides of the invention (see AAY95405-26) that are analogues of certain sites in the H domain 3, in this case amino acid residues Asn275-Lys282. The peptides inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting angiogenesis, inhibiting endothelial cell proliferation, and inducing endothelial cell apoptosis. Cancer, rheumatchid arthritis, and ocular disorders cell apoptosis. Cancer, rheumatchid arthritis, and ocular disorders cell apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Composition for inhibiting angiogenesis and endothelial cell proliferation, inducing endothelial cell apoptosis and treating cancer, rheumatoid arthritis, and ocular disorders comprises a kininogen domain
                                                                                                                                                                        The present sequence is that of domain 3 of human high mol.wt. kininogen (HK). The invention provides peptides (see AAV95405-24) that are analogues of certain sites in the HK domain 3, specifically Asn275-Lys282, Cys246-Cys249, Leu331-Tyr338 and Tyr299-Ser314. The peptides, in which native Cys residues may be replaced by Ala residues, inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting angiogenesis, inhibiting endothelial cell apoptosis. and inducing endothelial cell apoptosis. Cancer, rheumatoid arthritis, and coular disorders characterized by undesired vascularization of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to inhibition of the enzymatic activity of legumain or a legumain-related endopeptidase by cystatin. The inhibition involves an interaction between legumain and a papain-non-reactive site of cystatin. Legumain (EC 3.4.22.34) is a cysteine endopeptidase, and performs a protein-processing function. The present sequence is human kininogen D3, which was used in the present invention. Kininogen is a type 3 cystatin.

polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymcleotides are also used in diagnostics as expressed sequence tags: polymcleotides are also used in diagnostics as expressed sequence tags to reactor normal activity of (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving cuantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymcleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations ceptor produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequence of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO. at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 52; DB 22; Length 369;

polypeptide (II) sequences. (I) is useful as hybridisation probes, and gone mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques of restranger for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and among a milno acid sequences of the invention.

Conduction in the printed diagnostic anno acid sequences of the invention.

Conduction in the printed conducts dependent on but and diagnostic anno acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1; chromosome mapping; gene mapping; gene therapy; forensic; supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                                                                 ö
         polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). Is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                       and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chromosome
                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromo and gene mapping, and in recombinant production of (II). The

polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as
                                                                                                                                                                                  a food supplement. (1) and its binding partners are useful in medical imaging of sites expressing (II). (1) and (II) are useful in medical imaging of sites expressing (II). (1) and (II) are useful for treating discretes involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bradykinin is a peptide consisting of nine amino acids. It has the biological effect of decreasing blood pressure. Although kininogen is known as a protein-precursor of bradykinin, its structure is unknown because of the difficulty in collecting large enough samples of kininogen for structural investigation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

Till, given in AAG81454 to AAG81320, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their certainty and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH55971 to AAH55090 represent oligonucleotide sequences from the present invention. AAH55091 to AAH56098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                                                                                                                                                                                                AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plasmodium falciparum; chromosome 2; human malaria parasite; vaccine; antimalarial; malaria; protozoacide; infection; insecticide.
                                                                                                                                                                                                                                                                                                     Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

It has the biological effect of decreasing blood pressure. Although kininogen is known as a protein-precursor of bradykinin, its structure is unknown because of the difficulty in collecting large enough samples of kininogen for structural investigation.

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comppising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polycional antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of farget treat or prevent P. falciparum infection, or they can be used to identify drug resistance in confection, or they can be used to identify drug resistance in complexity of the parasite biology, a process hampered by the subsequent identification of proteins encoded by it will help to expand complexity of the parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and mosquito and protein sequences given in the pressing incention, but which are not
                                                                                                                                                                                                                                                                                                                                                              Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 71.4%; Score 40; DB 21; Length 540; 66.7%; Pred.
